

Do you have a Computer?

Then ask yourself these questions:

Why does my computer run slowly?

Why does it crash for no reason?

Is my personal information secure?

Is my business information secure?

Why is my home page changed?

Why do I get all these popups?

Does my computer have a virus?

Is someone spying on my computer?

If you answered "Yes" to any of these questions or if you don't know if your valuable business and personal information stored on your computer is safe, then **you are not alone.**

Statistics show that 90% of all computers are infected with **spyware**. These programs track your computer usage and can steal your valuable personal and business information including credit card numbers, passwords, email addresses and business contacts. Then they can send it to unscrupulous web sites where it can be used for **fraudulent purposes.**

While some spyware is relatively harmless, others hog system memory, slowing down your computer, and make it unstable causing it to crash and you to **lose precious time and money.**

You don't have to put up with these computer problems. Call K2HealthTech for a computer check-up and **take control of your computer** instead of letting the computer hackers take control of you.

Now you don't have to go it alone...
